		Berichtsdatum / Date of report:	08.03.2019

1. Prüfgegenstand / Specimen

Produkt/Material / Product/Material: wiping cloth "Breazy" Vileda Professional, neutral cleaner solution: Tana Green

2. Untersuchung / Examination

Microbiological examination of products

Examination of the reducing effect of wiping cloth "Breazy" moistened with neutral cleaner solution on two bacteria strains.

3. Prüfverfahren und Normverweis / Test method and standard

The present study is based on DIN EN ISO 11737-1: 2009-09, DIN EN ISO 846, method C: 1997-06 and the customer's instructions (see e-mails 11.02, 14.02. and 18.02.2019). The test was performed in a clean bench on a pre-cleaned and disinfected test surface.

Wiping cloth: "Breazy" Vileda Professional

Neutral cleaner: Tana Green care 04631 (TANA Chemie GmbH, Mainz, Germany), applied concentration 0,5%

Bacteria test strains: *Pseudomonas aeruginosa* (DSM-Nr. 288), *Staphylococcus aureus* (6538 DSM-Nr. 346)

Test surface: PVC flooring, non-structured (98 cm x 27 cm), disinfected; divided into 39 squares 9 cm x 7 cm each.

Samples 1.1 to 1.3: Negative control after disinfection, samples 1.4 to 1.9: Positive control after bacteria application, samples 1.10 to 1.39: treated sample squares after bacteria application and cleaning with the test cloth.

Applied bacteria suspension

5 ml of mixed bacteria suspension (*P. aeruginosa* + *S. aureus* 1 + 1) $1,4 \times 10^8$ cfu (colony forming unit); calculated amount per test sample (9 cm x 7 cm): $3,6 \times 10^6$.

Cleaning procedure

The cloth was fixed in a double layer to lab a testing device (provided by the customer) consisting of a massive plastic block (9 cm x 6 cm) and ensuring a homogenous pressure. It was moistened with 0,5% neutral cleaner in water (200% of the wiping cloth weight). Then the cloth with the block was wiped once across the test surface by moving it in form of an 8 at a speed of approx. 5 cm/s based on instructions of the manufacturer.

Evaluation and determination of bacteria from the sample squares

Samples were incubated in 15 ml 0,9% NaCl solution in a falcon tube and shaked 20 min end to end. The bacteria concentration of the suspension was analysed using the spread plate method (100 µl plating volume of dilution series) and/or the pouring method for samples with expected high or low bacteria contamination respectively. The agar plates were cultivated 3-5 days at 30°C.
